Not illustrated. 1920 Excerpt: .in the same way as that of a column cap for the same length of span. It will be found that the brick wall will be subjected to some bending in a similar manner to a concrete column. The amount of this bending will probably be less than that occurring in a concrete column. It is well, however, to make an investigation of the stresses occurring in the pilaster by combining the direct load with the bending moment given previously for exterior columns. The pilaster size used should be such that little or no tension is found upon combining the direct load and bending, and also that the maximum compression is within that allowable upon the kind of brickwork used. 96. Rectangular Panels.--Fin! slab construction proves most economical in panels which are approximately square and engineers should endeavor to make their layouts accordingly. Most codes and rulings provide that the methods of analysis given are limited to panels in which the long side is not greater than 1.33 times the short side. It has been the writer s practice in cases where this proportion was exceeded to a slight extent, to increase the length of the short side for design purposes only so that this proportion of spans was maintained. Thus, a panel 20 X 28 ft. would be treated in the design as if it were a panel 21 X 28 ft. It will be noted by referring to the total bending moment formula given...
